

Herbert Muller Wilcke

Incident report analysis:

ICMP DOS

Summary	During the day, we identified that network services had stopped functioning. Initially, the employee believed it was a Wi-Fi issue, but further investigation revealed suspicious network traffic.
Identify	After analyzing the logs, the analyst observed a large volume of ICMP packets. Based on this evidence, it was concluded that the organization had been targeted by a Denial of Service (DoS) attack, specifically an ICMP flood attack, which impacted the availability of network services.
Protect	To protect the organization's assets as quickly as possible and restore critical operations, we implemented new firewall rules to limit ICMP traffic. Additionally, we configured the Intrusion Prevention System (IPS) to detect and block malicious traffic that bypasses firewall controls. Source verification mechanisms were also implemented to help identify and manage the origin of the attack traffic. the implementation of a reverse proxy service such as Cloudflare was recommended. This solution can help absorb and filter malicious traffic before it reaches the organization's infrastructure, providing additional protection against both DoS and DDoS attacks.
Detect	To prepare for future attacks, we configured the IDS and the SIEM to monitor and detect anomalous network traffic.
Respond	To respond to the attack, we blocked the source IP address and enforced the newly implemented security policies. Based on our analysis, the incident was identified as a DoS attack rather than a DDoS attack, allowing us to effectively mitigate the threat by filtering traffic from the offending source. Additionally, new firewall rules were deployed to minimize the impact of similar attacks in the future.
Recover	Following the implementation of the new security policies and system hardening measures, the team will restore the affected services. These actions are expected to return operations to normal while ensuring greater control, security, and resilience against future incidents.
